Presentation

The study cycle aims to develop proficiency and innovation in clinical psychology research and to develop advanced skills for integrating scientific knowledge into the process of psychological assessment and intervention, focusing on the most recent developments of the cognitive behavioral model and its application using new technologies. It is intended that students develop specialized knowledge in clinical psychology that contributes to the theoretical, methodological and empirical progress of the area both in the national and international context as well as to the scientifically oriented professional practice. Students will be exposed to a diversity of theoretical developments and scientific methodologies, promoting critical thinking, scientific autonomy in the reflection process and development of advanced research in clinical psychology. Participation in national and international research networks and the dissemination of research results to peers and communities is encouraged.

STUDY PLAN

1st Year / Comon Core

Anual	ects	1º Semestre	ects	2º Semestre	ects
