Presentation

The rapid development of space technologies and economic policies for the sector, particularly in Europe and the U.S. has spurred a new space-based economy as a driver of innovation and growth. With estimated returns ranging from 3 to 7 euros per euro invested, new public and private actors have emerged, consolidating the transition from the New Space Economy to the concept of Next Space. In this context, challenges related to artificial intelligence, quantum communications, space exploration, security, and defense are creating new opportunities for companies and governments. Portugal is strengthening its position through its national space strategy, focusing on workforce development, innovation, and space services. Consequently, specialized training in management applied to the aerospace sector has become essential.
